This volume is part of the definitive edition of letters written by and to Charles Darwin, the most celebrated naturalist of the nineteenth century. Notes and appendixes put these fascinating and wide-ranging letters in context, making the letters accessible to both scholars and general readers. Darwin depended on correspondence to collect data from all over the world, and to discuss his emerging ideas with scientific colleagues, many of whom he never met in person. The letters are published chronologically. In 1880, Darwin published *On The Power of Movement in Plants*, and began writing his final book, *The Formation of Vegetable Mould through the Action of Worms*. He was engaged in controversy with Samuel Butler, following publication of his last book, *Erasmus Darwin*. At the end of the year, he succeeded in raising support for a Civil List pension for Alfred Russel Wallace, co-discoverer of the theory of natural selection.

The family is a major area of scholarly research and public debate. Many studies have explored the English family in the sixteenth and seventeenth centuries, focusing on husbands and wives, parents and children. *The Ties that Bind* explores in depth the other key dimension: the place of brothers and sisters in family life, and in society. Moralists urged mutual love and support between siblings, but recognized that sibling rivalry was a common and potent force. The widespread practice of primogeniture made England distinctive. The eldest son inherited most of the estate and with it, a moral obligation to advance the welfare of his brothers and sisters. *The Ties that Bind* explores how this operated in practice, and shows how the resentment of younger brothers and sisters made sibling relationships a heated issue in this period, in family life, in print, and also on the stage.

Interest in herbal medicines, aromatherapy, and other traditional applications of aromatic plants has increased tremendously over the last few years. However, very little "hard data" on the properties and uses of these plants has been available until now. This handbook provides the most complete collection of chemical data available on aromatic mints (Lamiaceae). The authors introduce the new field of study, aromathematics, which involves aromatic compounds and their biological activities. This book contains a wealth of quantitative data, including more than 500 references on 10,839 chemicals from 251 assays of 205 unique taxa, combined with 3,324 biological activities and 256 recommended daily allowances and lethal doses. An exhaustive guide, the handbook is the ultimate resource for assessing the potential medicinal value of a particular species.
