In most schools you will probably see one, if not all of the following: Metal detectors to prevent handguns and other weapons from being brought onto school property Students in standardized uniforms to prevent the appearance of gang affiliations Police officers patrolling the property to deter violent activity as well as respond to incidents Such evolutions have forever changed how we view the safety of our students. However, the phrase "school safety" goes beyond these issues of security put in place to protect students, faculty, and staff.

Environmental factors also play a role. The Comprehensive Handbook of School Safety expands the dialogue on school safety to comprehensively address the spectrum of safety risks such as bullying, fire safety,

playground and transportation safety, and more. Based on research and practical experience, it helps school administrators develop appropriate programs that protect all individuals from harm. Author E. Scott Dunlap brings his experience in OSHA and DOT compliance, behavior-based safety, and organizational safety culture to bear on the issue of school safety. He presents school safety from a holistic perspective and details vulnerability assessment tools and incident investigation forms to help schools develop a comprehensive safety program. By focusing on this range of issues, the book's dynamic perspective puts the keys to achieving an effective safety program within easy reach.

Lees'—the process safety encyclopedia trusted worldwide for over 30 years Provides safety professionals with the core information they need to understand the most common safety and loss prevention challenges Covers the latest standards and presents information, including recent incidents such as Texas City and Buncefield This SpringerBrief focuses on the use of egress models to assess the optimal strategy for total evacuation in high-rise buildings. It investigates occupant relocation and evacuation strategies involving the exit stairs, elevators, sky bridges and combinations thereof. Chapters review existing information on this topic and describe case study simulations of a multi-component exit strategy. This review provides the architectural design, regulatory and research communities with a thorough understanding of the current and emerging evacuation procedures and possible future options. A model case study simulates seven possible strategies for the total evacuation of two identical twin towers linked with two sky-bridges at different heights. The authors present the layout of the building and the available egress components including both vertical and horizontal egress components, namely stairs, occupant evacuation elevators (OEEs), service elevators, transfer floors and sky-bridges. The evacuation strategies employ a continuous spatial representation evacuation model (Pathfinder) and are cross-validated by a fine network model (STEPS). Assessment of Total Evacuation Systems for Tall Buildings is intended for practitioners as a tool for analyzing evacuation methods and efficient exit strategies.
