Tavistock Press was established as a co-operative venture between the Tavistock Institute and Routledge & Kegan Paul (RKP) in the 1950s to produce a series of major contributions across the social sciences. This volume is part of a 2001

reissue of a selection of those important works which have since gone out of print, or are difficult to locate. Published by Routledge, 112 volumes in total are being brought together under the name The International Behavioural and Social Sciences Library: Classics from the Tavistock Press. Reproduced here in facsimile, this volume was originally published in 1967 and is available individually. The collection is also available in a number of themed mini-sets of between 5 and 13 volumes, or as a complete collection.

As global health inequities continue to widen, policymakers are redoubling their efforts to address them. Yet the effectiveness and quality of these programs vary considerably, sometimes resulting in the reverse of expected outcomes. While local political issues or cultural conflicts may play a part in these situations, an important new book points to a universal factor: the prevailing deficit model of assessing health needs, which puts disadvantaged communities on the defensive while ignoring their potential strengths. The asset model proposed in *Health Assets in a Global Context* International Health and Development offers a necessary complement to the problem-focused framework by assessing multiple levels of health-promoting aspects in populations, and promoting joint solutions between communities and outside agencies. The book provides not only rationales and methodologies (e.g., measuring resilience and similar elusive qualities) but also concrete examples of asset-based initiatives in use across the world on the individual and community levels.

First multi-year cumulation covers six years: 1965-70.

First published in 1983. Routledge is an imprint of Taylor & Francis, an informa company.

The sixth in a series of congressionally mandated reports on Gulf War veterans' health, this volume evaluates the health effects associated with stress. Since the launch of Operation Desert Storm in 1991, there has been growing concern about the physical and psychological health of Gulf War and other veterans. In the late 1990s, Congress responded by asking the National Academy of Sciences (NAS) to review and evaluate the scientific and medical literature regarding associations between illness and exposure to toxic agents, environmental or wartime hazards, and preventive medicines or vaccines in members of the armed forces who were exposed to such agents. Deployment to a war zone has a profound impact on the lives of troops and on their family members. There are a plethora of stressors associated with deployment, including constant vigilance against unexpected attack, difficulty distinguishing enemy combatants from civilians, concerns about survival, caring for the badly injured, and witnessing the death of a person. Less traumatic but more pervasive stressors include anxiety about home life, such as loss of a job and income, impacts on relationships, and absence from family. The focus of this report, by the Institute of Medicine (IOM) Committee on Gulf War and Health: Physiologic, and Psychosocial Effects of Deployment-Related Stress, is the long-term effects of deployment-related stress. Gulf War and Health: Volume 6. Physiologic, and Psychosocial Effects of Development Related Stress evaluates the scientific literature regarding association between deployment-related stressors and health effects, and

provides meaningful recommendations to remedy this problem.

Calling on the methodology of psychology, the authors explore the way illness alters the self-image of the sick person, and the way the experience changes the person who is ill. The reader is taken through the psychological impacts of the first clinical moment when the patient realizes he or she is in the altered state of illness, as well as the subsequent effects of pain, hospitalization, being bed-ridden, fatigued or disabled. The central thesis is that an integral picture of medicine must include social-cultural aspects, the institutionalization of health care, and an attempt to provide patient-centered care. The approach taken is the empirically based psychosocial reflection of the disturbances to a person's self-image caused by various kinds of illness. Focusing on the world of the patient, the authors relate to problems concerning self-image, pain, exhaustion, isolation, handicaps, aging, dying and death. The relationships between patients and medical personnel are also examined. Concluding the work is an excellent bibliography keyed to the chapters of the text.
