Structural Analysis of Historical Constructions. Anamnesis, diagnosis, therapy, controls contains the papers presented at the 10th International Conference on Structural Analysis of Historical Constructions (SAHC2016, Leuven, Belgium, 13-15 September 2016). The main theme of the book is "Anamnesis, Diagnosis, Therapy, Controls", which emphasizes the importance of all steps of a restoration process in order to obtain a thorough understanding of the structural behaviour of built cultural heritage. The contributions cover every aspect of the structural analysis of historical constructions, such as material characterization, structural modelling, static and dynamic monitoring, non-destructive techniques for on-site investigation, seismic behaviour, rehabilitation, traditional and innovative repair techniques, and case studies. The knowledge, insights and ideas in Structural Analysis of Historical Constructions. Anamnesis, diagnosis, therapy, controls make this book of abstracts and the corresponding, digital full-colour conference proceedings containing the full papers must-have literature for researchers and practitioners involved in the structural analysis of historical constructions.

Mixing scientific, historic and socio-economic vision, this unique book complements two previously published volumes on the history of continuum mechanics from this distinguished author. In this volume, Gérard A. Maugin looks at the period from the renaissance to the twentieth century and he includes an appraisal of the ever enduring competition between molecular and continuum modelling views. Chapters trace early works in hydraulics and fluid mechanics not covered in the other volumes and the author investigates experimental approaches, essentially before the introduction of a true concept of stress tensor. The treatment of such topics as the viscoelasticity of solids and plasticity, fracture theory, and the role of geometry as a cornerstone of the field, are all explored. Readers will find a kind of socio-historical appraisal of the seminal contributions by our direct masters in the second half of the twentieth century. The analysis of the teaching and research texts by Duhem, Poincaré and Hilbert on continuum mechanics is key: these provide the most valuable documentary basis on which a revival of continuum mechanics and its formalization were offered in the late twentieth century. Altogether, the three volumes offer a generous conspectus of the developments of continuum mechanics between the sixteenth century and the dawn of the twenty-first century. Mechanical engineers, applied mathematicians and physicists alike will all be interested in this work which appeals to all curious scientists for whom continuum mechanics as a vividly evolving science still has its own mysteries.

Das Interesse für stossartige Belastungen von Tragwerken als sehr kurzzeitige äussere Einwirkungen hat in letzter Zeit stark zugenommen. Immer mehr sieht sich der Bauingenieur solch ungewöhnlichen Beanspruchungen gegenüber, wie z. B. Stoss von Fahrzeugen oder Flugzeugen gegen wichtige Bauteile, Explosionen, Steinschlagprobleme oder Sprungbelastungen infolge Ausfalls tragender Elemente. Dabei stehen meist die dynamische Reaktion des Bauteils oder Bauwerks und dessen Fähigkeit zur plastischen Energieabsorption im Vordergrund. Die zunehmende Bedeutung solcher Fragestellungen war mit ein Grund, dass im Jahr 1977 am Institut für Baustatik und Konstruktion der Eidgenössischen Technischen Hochschule Zürich ein Forschungsprojekt begonnen wurde mit dem Ziel, die Wirkungen stossartiger Belastungen auf Stahlbeton- und Spannbetontragwerke besser kennen und erfassen zu können. Dabei wurden neuartige Wege eingeschlagen indem als Stossenergie die Fallenergie des gestossenen Elementes selbst verwendet wurde. Die Ergebnisse der experimentellen Untersuchungen an Materialproben, an einfachen Balken und an Durchlaufträgern wurden in mehreren Berichten und Publikationen festgehalten. Die vorliegende Dissertation enthält im wesentlichen die im Rahmen des Forschungsprojektes gewonnenen theoretischen Erkenntnisse. Nach einer Charakterisierung des Materialverhaltens bei erhöhten Dehngeschwindigkeiten werden analytische Modelle für das dynamische Verhalten sowie für die Tragfähigkeit und das Verformungsvermögen fallender und einseitig aufprallender Stahl- und Spannbetonbalken entwickelt. Für die Praxis von besonderem Interesse sind die an Durchlaufträgern nach plötzlichem Ausfall einer Unterstützung durchgeführten Untersuchungen. Hier gelang es, einfache und effiziente Rechenverfahren mit Hilfe plastischer Gelenke und Starrkörperbewegungen zu entwickeln, mit denen sozusagen 'von Hand' das komplexe dynamische Verhalten zutreffend erfasst werden kann.

Designing and manufacturing structures of all kinds in an economic and a safe way is not possible without doing experimental stress analysis. The modernity of structures, with their higher reliability demands, as well as today's more stringent safety rules and extreme environmental conditions necessitate the improvement of the measuring technique and the introduction of new ones. Although theoretical/mathematical analysis is improving enormously, an example of which is the finite element model, it cannot replace experimental analysis and vice versa. Moreover, the mathematical analysis needs more and more accurate parameter data which in turn need improved experimental investigations. No one can do all those investigations on his own. Exchange of knowledge and experience in experimental stress analysis is a necessity, a thing acknowledged by every research worker. Therefore, the objective of the Permanent Committee for Stress Analysis (PC SA) is to promote the organization of conferences with the purpose disseminating new research and new measuring techniques as well as improvements in existing techniques, and furthermore, to promote the exchange of experiences of practical applications with techniques. This VIIIth International Conference on Experimental Stress Analysis on behalf of the PC SA is one in a series which started in 1959 at Delft (NL), and was followed by conferences at Paris (F), Berlin-W, Cambridge (~K), Udine (I), Munich (FRG) and Haifa (Isr.). Such a Conference will be held in Europe every fourth year, half-way between the IUTAM Congresses.

Un véritable aide-mémoire. La résistance des matériaux est l'étude du comportement des matériaux en traction, compression, flexion et torsion pour en déterminer les conditions d'emploi. Elle permet de calculer la résistance des différents matériaux : le bois, le béton ou l'acier. Cet aide-mémoire de résistance des matériaux présente des méthodes de calcul, des formules pratiques et théoriques, des abaques illustrant des cas pratiques immédiatement applicables. Les nombreuses figures de l'ouvrage montrent en détail les éléments de base à prendre en compte, tels que les fibres tendues, le moment positif, etc. De plus, des tableaux présentant les propriétés géométriques et mécaniques de nombreux profilés, pièces ou corps y sont inclus : 342 cas pour la flexion des poutres, pour les systèmes isostatique et hyperstatique; 90 cas pour la flexion de plaque mince et épaisse (disque) ; 105 cas pour la flexion de coque mince et épaisse; 142 cas pour le flambement de pièce élancée, le voilement de plaque mince et le cloquage de coque mince. 13 cas pour les contraintes de compression au contact des surfaces courbes. Cet aide-mémoire est complémentaire de son premier livre "Formulaire de résistance des matériaux" Editions Eyrolles, 2002, ISBN 2-212-00525-3. Cet ouvrage est à l'attention des personnes, qui souhaitent connaître plus de formules pratiques, plus de théorie et autres domaines de déformation. Par exemple : la déformation au contact. À qui s'adresse cet ouvrage? La présentation des schémas et des formes de tableaux de synthèse fait de cet ouvrage un outil pratique pour les professeurs, les étudiants, les ingénieurs, les techniciens et les architectes qui ont besoin d'effectuer des calculs de résistance des matériaux et de trouver rapidement des formules pratiques. Les nombreux exemples résolus permettent de mieux comprendre et utiliser les formules pratiques. [Source : d'après la 4ème de couv.]

Three subjects of major interest in one textbook: linear elasticity, mechanics of structures in linear isotropic elasticity, and nonlinear mechanics including computational algorithms. After the simplest possible, intuitive approach there follows the mathematical formulation and analysis, with computational methods occupying a good portion of the book. There are several worked-out problems in each chapter and additional exercises at the end of the book, plus mathematical expressions are very often given in more than one notation. The book is intended primarily for students and practising engineers in mechanical and civil engineering, although students and experts from applied mathematics, materials science and other related fields will also find it useful.

This book traces the evolution of theory of structures and strength of materials - the development of the geometrical thinking of the Renaissance to become the fundamental

engineering science discipline rooted in classical mechanics. Starting with the strength experiments of Leonardo da Vinci and Galileo, the author examines the emergence of individual structural analysis methods and their formation into theory of structures in the 19th century. For the first time, a book of this kind outlines the development from classical theory of structures to the structural mechanics and computational mechanics of the 20th century. In doing so, the author has managed to bring alive the differences between the players with respect to their engineering and scientific profiles and personalities, and to create an understanding for the social context. Brief insights into common methods of analysis, backed up by historical details, help the reader gain an understanding of the history of structural mechanics from the standpoint of modern engineering practice. A total of 175 brief biographies of important personalities in civil and structural engineering as well as structural mechanics plus an extensive bibliography round off this work.

Includes analysis of the Charleston harbor.

Provides a thorough review of properties, durability and use of high performance concrete, derived from recent research and experience. This book contains contributions from the leading French, Canadian and Swiss researchers, designers and material specialists, translated into English for the first time.

Volume 2 of History of Construction Cultures contains papers presented at the 7ICCH – Seventh International Congress on Construction History, held at the Lisbon School of Architecture, Portugal, from 12 to 16 July, 2021. The conference has been organized by the Lisbon School of Architecture (FAUL), NOVA School of Social Sciences and Humanities, the Portuguese Society for Construction History Studies and the University of the Azores. The contributions cover the wide interdisciplinary spectrum of Construction History and consist on the most recent advances in theory and practical case studies analysis, following themes such as: - epistemological issues; - building actors; - building materials; - building machines, tools and equipment; - construction processes; - building services and techniques ; -structural theory and analysis ; - political, social and economic aspects; - knowledge transfer and cultural translation of construction cultures. Furthermore, papers presented at thematic sessions aim at covering important problematics, historical periods and different regions of the globe, opening new directions for Construction History research. We are what we build and how we build; thus, the study of Construction History is now more than ever at the centre of current debates as to the shape of a sustainable future for humankind. Therefore, History of Construction Cultures is a critical and indispensable work to expand our understanding of the ways in which everyday building activities have been perceived and experienced in different cultures, from ancient times to our century and all over the world.

High Performance Concrete From material to structure CRC Press

Gives a clear and thorough presentation of the fundamental principles of mechanics and strength of materials. Provides both the theory and applications of mechanics of materials on an intermediate theoretical level. Useful as a reference tool by postgraduates and researchers in the fields of solid mechanics as well as practicing engineers.

This book provides the main topics currently used for the calculus of structures. The reference establishes a link between the traditional approach on the strength of materials and the present finite element method, details the main aspects of practical modeling, and explores numerous case studies.

For a long period Soil Mechanics has remained at the semi-empirica stage, and only a few decades ago it has shown a tendency to become a fundamental science. However, this evolution is taking place slowly; in spite of the efforts of numerous research scientists, the very complex rheological laws of soils are still not well known. Even if these laws were elucidated, it would take a long time still to deduce simple rules from them for reliable and convenient use in current practical engineering. In the pursuit of these distant aims - and of others more immediate - fundamental research and applied research are very active, both in Rheology and Soil Mechanics. The complexity of the problems to be solved should incite the laboratory researchers and the engineers to a continuous collaboration. Everyone acknowledges the advantage of these connections although aware of the difficulty of realizing this wish. However, contacts are being made little by little between the representatives of the different branches of Rheology and Soil Mechanics, to the great benefit of science. The bureau of the International Union of Theoretical and Applied Mechanics (IUTAM), aware of the importance of these two associated fields of mechanics, considered it possible to accelerate the natural and necessary process of their interpenetration by organizing in Grenoble, from 1st to 8th April 1964 an International Symposium on Rheology and Soil Mechanics.
