Climate change is upon us. Make no mistake: disasters such as Hurricane Katrina are the tip of a rapidly melting iceberg. While we must still press our governments to take action to mitigate the most extreme effects of global warming, it is now beyond doubt that prevention will not be enough. We clearly need to plan for the worst. But good advice is hard to come by - until now. The Global Warming Survival Kit includes: - Where to live to minimize the impact of climate change. - How to get drinkable water when the taps run dry. - What to eat to stay alive in town and country. - Essential survival equipment to keep ready. We can all hope that the worst scenario won't happen - but it's easier to be secure in that hope if you are well prepared.

The purpose of this Research Topic is to share the latest developments in the methods and application of implementation science. Briefly, implementation science is the study of methods to promote the adoption and integration of evidence-based practices, interventions, and policies into routine health care and public health settings. Implementation research plays an important role in identifying barriers to, and enablers of, effective health systems programming and policymaking, and then leveraging that knowledge to implement evidence-based innovations into effective delivery approaches.

When Spaniards speak of the Levante they refer to that long and narrow strip on the eastern Mediterranean coast claimed by the autonomous regions of Valencia and Murcia south of it. In this "land of the rising sun" the coastline, over 500 km (312 miles) of it, is a shared sight with the mountains rising in the interior. To the northwest the Iberian chain enters the region, bearing southeast toward the sea where the Turía and Mijares rivers end their journeys, while in the south the Béticos chain encroaches from Andalucía in its own march east to the coast. It is the thriving agricult.

When the Moors spread across the country during the eighth century they could never penetrate the Pyrenees, though they left quite a legacy in other parts of Aragón. By the ninth century the Christians had begun to reconsolidate in the Pyrenees; they formed the Kingdom of Aragón and made Jaca - today the most popular village among mountain sportsters - their earliest capital. The Romanesque churches scattered throughout the Pyrenees stand as a genteel testament to the devotion and determination of these rallying Christians. During the 12th century they had worked their way south into the wide.

Defining things through binary opposition – male/female, familiar/foreign, life/death – forms the base of human thinking. Adding moral assessment to logic, we often represent binaries even as divisions into good and evil. Exclusions based on the division of Us vs. Them make their presence felt during any conflict, and become crucial in times of war. However, binary thinking is inherent also in peaceful, everyday conversation, when politics, social issues, ethnicities and religious identities are described and debated. Binaries in Battle: Representations of Division and Conflict is a wide-ranging multidisciplinary anthology that presents the fundamental rationale of binary thinking from many different angles. The evidence is drawn from cases ranging from historical to contemporary and near future, covering both wartime and peacetime conflicts. The writers apply a wide variety of methods, including linguistics, visual semiotics, ethnography, and leadership and organisational analysis. Seemingly unconnected topics, such as humanitarianism and warfare, or death and tourism, appear strangely connected, and the relevance of speed to cyber warfare is revealed to contain a paradox. Mass immigration is observed from several, mutually exclusive angles to provide a 360 degree view. Despite its multifaceted baselines, the book provides a solid understanding of the manifestations of binary thinking. By deconstructing ideological discourses it dispels black-and-white imageries, replacing them with softer shades of grey.

Still regarded as “the bible” for both new and experienced kayakers after more than thirty years in print, Sea Kayaking covers the basics of equipment and technique, including types of paddles and strokes, as well as such essential skills as how to read the weather and the water, how to navigate with and without GPS and how to travel with a group. Drawing on his many years of experience paddling in all climates, John Dowd presents practical advice on dealing with potential hazards (from surf to sea ice to sharks), carrying out rescues and planning for long-distance expeditions. New for this edition are hints about digital technologies for planning and navigating while kayak touring as well as lots of tips for outfitting boats, adapting equipment and finessing fishing technique while kayak angling—whether casting and jigging for fun on a day trip or trolling for dinner on a longer expedition. Also fully updated are the sections on managing risk and the inspiring stories of adventure, including Freya Hoffmeister’s record-breaking circumnavigation of Australia and Japanese paddlers’ increasingly challenging trips around the islands and beyond. As a sport, sea kayaking continues to evolve. Once the sport of a very few long-distance paddlers embarking on international expeditions, then the recreational pursuit of many weekend tourers, sea kayaking is now popular with many day trippers as well. As more and more paddlers take to the water—for the day, the weekend or many months, this classic guide continues to be required reading for those seeking adventure on the open ocean.

As with all ecosystems, river systems involve a complex interaction of a rich diversity of micro-organisms, plants and animals with their physical and chemical environment. The river habitat presents unique problems for organisms exposed to unidirectional currents, seasonal variation in flow, and disturbance due to pollution and other human interference. The book starts with a description of the taxa, their adaptations and their ecologies, followed by chapters describing the ecosystem processes in terms of trophic interactions and the key production processes related to photosynthesis and decomposition. A major chapter then considers the principles, practices and problems associated with making reliable observations on river organisms, leading to final chapters investigating how river biota are impacted by human activity and how, in turn, they can be used as indicators of these effects in river-management programmes.
